

# Movie App

## Features

- Movies fetched from themoviedb.org API.
- Movies divided in sections based on their Genres.
- Search feature – search based on keyword.
- Authentication using Firebase Authentication.
- Like and Wishlist movies.
- Details about movies – ratings, release date, runtime, overview, reviews etc.
- Firebase Realtime database used to store liked and wish listed data.

There is stuff which haven't received much thought like back arrow for navigation and overflow menu indicator in movie details activity and liked and wish listed activity theme were having some problems which were not something that I encountered before so were taking time.

Reviews for movies have not been edited to collapse them in smaller views. Like and Wishlist activity not show the current state if movie is already liked or wish listed. There are no checks if a movie is already liked or wish listed. You might encounter some bugs again because time constraints are there.

Firebase AuthUI used to create the login/signup flow.

This app has been created as an MVP to fulfil the requirements mentioned in assignment details.

Hoping for the best. Thankyou.
